**At-A-Glance:**

A Summary of TB in Fresno County (2018)

Figure 1. Fresno County TB Incident Cases by Race/Ethnicity (2018). The majority of new TB cases self-identify as Hispanic. Categories representing <5% of total new cases are not represented.

Figure 2. Fresno County TB Incident Cases by Age (2018). TB cases in those older than 54 years of age represent over 50% of all new TB cases occurring in Fresno County.

Figure 3. Fresno County’s TB Trends by Year. This figure shows the number of new TB cases and incidence by year. Fresno County had 47 active TB cases in the year 2018, down from 62 in 2017.

Figure 4. Fresno County TB Incidence by Race & Ethnicity2 (2018). Asians/Pacific Islanders had the highest incident of TB in 2018 followed by Hispanics, Blacks and Whites respectively.

Figure 5. Percent of Fresno County TB Cases that are Foreign vs. US Born. This figure shows the percentage of TB cases that are foreign vs. US born from 2013-2018. Most TB cases from 2013-2018 occurred in people who are foreign born.

Figure 6. Fresno County’s Incident Cases of TB by Gender and Year. This figure shows the number of new cases, by year and gender, as well as the corresponding incidence. From 2013-2018, males had both a higher incidence of TB and a higher number of TB cases when compared to females.

---

1 Incidence is calculated per 100,000 persons
2 Hispanic may include people from any race (i.e. American Indian/Alaskan Native, Asian/Pacific Islander, Black, White, and Multi-Racial). All other race groups are non-Hispanic.
